

Enterprise Modernization Pilot Build Jumpstart

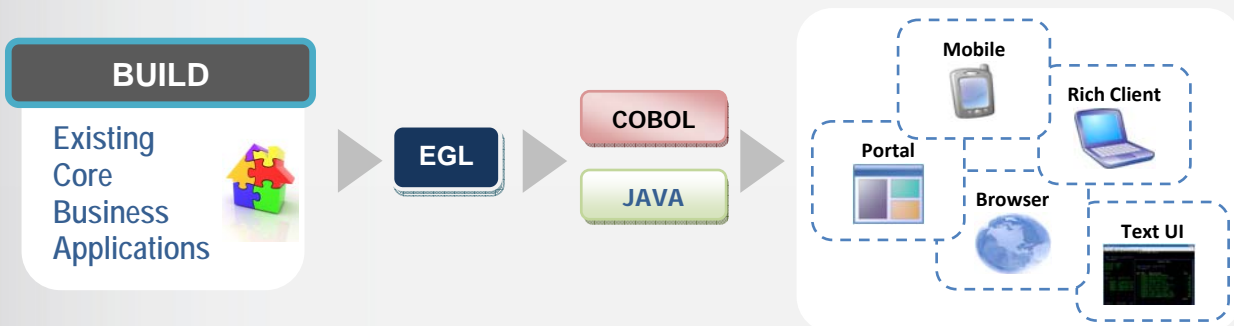

Build new applications with EGL

Develop new enterprise applications with current web functionality that will utilize the existing procedural skills of your staff. Free your developers from the tedium of coding platform specific, low-level implementation logic and enable them to create business logic. Broaden your focus on business solution and give yourself options for the future.

- Create modern web and Rich UI SOA applications using existing staff
- Deploy applications and services to a multitude of platforms, including i5/OS, WAS, z/OS, Linux, Windows

Whether on System i or System z, dealing with application code in COBOL, RPG or looking for a migration path for IBM VisualAge Generator, developing applications to be platform independent is an essential step to business application modernization.

Jumpstart Pilot Project

ClearBlade's Build Jumpstart Pilot allows you to typically spend 3 weeks with our specialists to modernize one of your business applications. Your legacy systems have value, let us help you extract and extend that value. Doesn't it make sense to begin by sampling a few colors before you paint the entire house?

Pricing

For a fixed cost, our experts will work with your team for a particular time period, including onsite collaboration. We will modernize a portion of an existing application and mentor your staff on the process. We will work together to identify the scope and functionality of the new system prior to project start.

Follow-on project discount

If you decide to move forward with a follow-on project, ClearBlade will apply up to 50% of the cost of the Jumpstart Pilot towards the new project.

Contact us
